

THE MYTH OF THE 'TEACHER VOICE'

We've all heard the classic line – and, if you're an educator, you've likely delivered it.

"I'LL JUST USE MY TEACHER VOICE."

Educators often don't think they need classroom audio solutions, instead choosing to rely on an elevated "teacher voice" to be heard. The truth is this perceived ability to rise above the din and distractions is a myth.

VOLUME IS NOT CLARITY

No matter how loud teachers are, consonants don't grow louder, and background noises will still drown them out.

MOVEMENT ALTERS REACH

When educators turn to write on the board or walk to another part of the room, vocal reach is impacted, affecting what children can hear.

KIDS FEEL SHOUTED AT

When a teacher raises their voice to reach the back, they shout at those in the front. How does this motivate students and boost their ability to learn?

STRAINS TEACHERS VOICES

Speaking loudly isn't sustainable. It leads to vocal fatigue, and 18% of teachers miss work each year due to voice strain. Though teachers are just 4.2% of the U.S. workforce, they make up 20% of clients in voice clinics.

THERE'S A BETTER WAY.

Being heard and understood isn't about the speaker – it's about the listener.
With classroom audio technology, the natural voice is enough for every student to hear, allowing every student to learn.
